

The DataRay Downtime Solution provides hospitals and pharmacies with a contingency plan for times when the IT system is down or offline due to maintenance or system failure.

Compact and Complete

Offering true stand alone functionality, the DataRay Advanced Printserver is bundled with a dedicated thermal printer. A second Ethernet connection provides a direct connection to a local PC for users to fill out a downtime form to print downtime labels and wristbands.

This printer station provides a web based downtime application that can also be accessed by any web browser for the purpose of printing patient wristbands and labels when RPMS is down. The DataRay interface to the thermal printer, prints fully formatted wristbands and labels on-demand in any critical situation.

Contingency plans during emergencies help enhance patient safety and address the requirements of JCAHO and other regulatory commissions.

A standalone solution that allows your workforce to put safety first—even in extreme emergency situations.

Barcode and Label Duplication

The DataRay Label Duplicator Code (LDC) allows staff to print duplicate labels or wristbands by simply scanning the 2D barcode. The DataRay Advanced Printserver prompts the thermal printer to generate duplicates without having to interface with the network or hospital information system (HIS).

This time-saving solution allows labels to be printed quickly and conveniently in nursing areas, saving valuable time while ensuring patient safety. Because the LDC station is a standalone solution, it continues to print on demand, even if both the HIS and the network are offline.
